Title: Optimizing High-Traffic E-commerce on AWS

Content: We just completed a major database migration to Aurora MySQL to better handle our target of 12,000 RPM. By fine-tuning the indexers and configuring CloudFront alongside our EC2 instances, the response times have dropped significantly. Monitoring the p99 metrics closely in New Relic to ensure everything remains stable through the weekend traffic spike.

Title: Asset Tracking System: Moving to React & Node.js

Content: The refactoring of the legacy ATS platform is well underway. Shifting the core application stack to Node.js for the backend and React for the frontend has already simplified our deployment workflows. We are currently finalizing the primary modules and ensuring all historical tracking data maps correctly to the new database architecture.

Title: Configuring RAID on the Dell PowerEdge

Content: Spent the afternoon troubleshooting the home lab setup. Successfully installed Ubuntu and got the SAS/SATA RAID controller configured on the old Dell PowerEdge 2950. It's definitely noisy, but it's going to be a solid environment for safely testing out new Traefik routing rules and Fail2Ban configurations before pushing anything to the cloud.

Title: UI Rendering and Typography Test #004

Content: This is a standard text block designed to verify character limits, paragraph spacing, and text wrapping within the application's frontend layout. Testing line breaks. Testing how the container handles longer paragraphs that might exceed standard viewport widths. The goal here is to ensure that the user interface remains responsive and that the "Back to posts" navigation component does not overlap with the main content area on smaller mobile screens.

Load balancer ARN arn:aws:elasticloadbalancing:ap-south-1:557107970045:loadbalancer/app/ror-app-dev-alb/13a72a76d901917b		DNS name info ror-app-dev-alb-245014845.ap-south-1.elb.amazonaws.com (A Record)	

Listeners and rules (1)

A listener checks for connection requests on its configured protocol and port. Incoming requests are evaluated against rules in priority order; the first matching rule determines routing. If no rule matches, the default action is applied.

Filter listeners

Protocol/Port	Default action	Rules	ARN	Security policy	Default SSL/TLS certificate	mTLS
Forward to target group

Deregister

Register targets

Target groups route requests to individual registered targets using the protocol and port number specified. Health checks are performed on all registered targets according to the target group's health check settings. Anomaly detection is automatically applied to HTTP/HTTPS target groups with at least 3 healthy targets.

EC2 > Load balancers

Load balancers (1/1) What's new?

Elastic Load Balancing scales your load balancer capacity automatically in response to changes in incoming traffic.

Filter load balancers

Name	State	Type	Scheme	IP address type	VPC ID	Availability Zones	Security groups
ror-app-dev-alb	Active	application	Internet-facing	IPv4	vpc-0d8c501d15588757	2 Availability Zones	sg-076894dd33cf

Load balancer: ror-app-dev-alb

Listeners and rules (1) Info

A listener checks for connection requests on its configured protocol and port. Incoming requests are evaluated against rules in priority order; the first matching rule determines routing. If no rule matches, the default action is applied.

Filter listeners

Protocol:Port	Default action	Rules	ARN	Security policy	Default SSL/TLS certificate	mTLS
HTTP:80	Forward to target group ror-app-dev-tg-1 (100%) Target group stickiness: Off	1 rule	ARN	Not applicable	Not applicable	Not applicable
